## Lecture 10: Lots of Reductions, Rice's Theorem

**Next Tuesday (2/17)**

**Your Midterm: At 12:50pm,  
in Bishop Auditorium**

**(see website for more information)**

**Today: instead of a new homework,  
you'll get a practice midterm**

**Don't panic!**

**Practice midterm will be harder than midterm**

**Next Tuesday (2/17)**

**Your Midterm: At 12:50pm,  
in Bishop Auditorium**

**FAQ: What is fair game for the midterm?**

**Everything up to this lecture**

**FAQ: Can I bring notes?**

**Yes, one single-sided sheet of notes, letter paper**

**Definition:** A decidable predicate  $R(x,y)$  is a proposition about the input strings  $x$  and  $y$ , such that some TM  $M$  implements  $R$ . That is,

for all  $x, y$ ,  $R(x,y)$  is TRUE  $\Rightarrow M(x,y)$  accepts  
 $R(x,y)$  is FALSE  $\Rightarrow M(x,y)$  rejects

Can think of  $R$  as a function from  $\Sigma^* \times \Sigma^* \rightarrow \{T,F\}$

**EXAMPLES:**  $R(x,y)$  = “ $xy$  has at most 100 zeroes”  
 $R(N,y)$  = “TM  $N$  halts on  $y$  in at most 99 steps”

**Proposition:**  $A$  is decidable if and only if there is some decidable predicate  $R$  such that  
$$A = \{x \mid R(x,\epsilon)\}$$

**Theorem:** A language  $A$  is *recognizable* if and only if there is a **decidable predicate**  $R(x, y)$  such that:

$$A = \{ x \mid \exists y R(x, y) \}$$

**Proof:** (1) If  $A = \{ x \mid \exists y R(x, y) \}$  then  $A$  is recognizable

A TM can enumerate over all  $y$ 's and try them in  $R$ .  
If there is a  $y$  s.t.  $R(x, y)$  accepts, it will be found

(2) If  $A$  is recognizable, then  $A = \{ x \mid \exists y R(x, y) \}$

Let  $M$  recognize  $A$ .

Let  $R(x, y)$  be TRUE iff  $M$  accepts  $x$  in  $|y|$  steps

$$M \text{ accepts } x \Leftrightarrow \exists y R(x, y)$$

# Mapping Reductions

$f: \Sigma^* \rightarrow \Sigma^*$  is a **computable function** if there is a Turing machine  $M$  that halts with just  $f(w)$  written on its tape, for every input  $w$

A language  $A$  is **mapping reducible** to language  $B$ , written as  $A \leq_m B$ , if there is a computable  $f: \Sigma^* \rightarrow \Sigma^*$  such that for every  $w$ ,

$$w \in A \Leftrightarrow f(w) \in B$$

$f$  is called a **mapping reduction**  
(or **many-one reduction**) from  $A$  to  $B$

**Theorem:** If  $A \leq_m B$  and  $B$  is decidable,  
then  $A$  is decidable

**Corollary:** If  $A \leq_m B$  and  $A$  is undecidable,  
then  $B$  is undecidable

**Theorem:** If  $A \leq_m B$  and  $B$  is recognizable,  
then  $A$  is recognizable

**Corollary:** If  $A \leq_m B$  and  $A$  is unrecognizable,  
then  $B$  is unrecognizable

**Theorem:**  $A_{TM} \leq_m \text{HALT}_{TM}$

$f(z) :=$  Decode  $z$  into a pair  $(M, w)$

Construct  $M'$  with the specification:

“ $M'(w)$  = Simulate  $M$  on  $w$ .

if  $M(w)$  accepts then *accept*

else *loop forever*”

Output  $(M', w)$

We have  $z \in A_{TM} \iff (M', w) \in \text{HALT}_{TM}$

**Theorem:**  $A_{TM} \leq_m \text{HALT}_{TM}$

**Corollary:**  $\neg A_{TM} \leq_m \neg \text{HALT}_{TM}$

**Proof?**

**Corollary:**  $\neg \text{HALT}_{TM}$  is unrecognizable!

**Proof:** If  $\neg \text{HALT}_{TM}$  were recognizable, then  
 $\neg A_{TM}$  would be recognizable...

**Theorem:**  $\text{HALT}_{\text{TM}} \leq_m A_{\text{TM}}$

**Proof:** Define the computable function:

$f(z) :=$  Decode  $z$  into a pair  $(M, w)$

Construct  $M'$  with the specification:

“ $M'(w)$  = Simulate  $M$  on  $w$ .

If  $M(w)$  halts then *accept*  
else *loop forever*”

Output  $(M', w)$

Observe  $(M, w) \in \text{HALT}_{\text{TM}} \iff (M', w) \in A_{\text{TM}}$

# Corollary: $\text{HALT}_{\text{TM}} \equiv_m \text{A}_{\text{TM}}$

Yo, T.M.! I can give you the magical power to either compute the halting problem, or the acceptance problem. Which do you want?

Wow, hm, so hard to choose...

I can't decide!

# The Emptiness Problem

$\text{EMPTY}_{\text{DFA}} = \{ M \mid M \text{ is a DFA such that } L(M) = \emptyset \}$

*Given a DFA, does it reject every input?*

**Theorem:**  $\text{EMPTY}_{\text{DFA}}$  is decidable

Why?

$\text{EMPTY}_{\text{NFA}} = \{ M \mid M \text{ is a NFA such that } L(M) = \emptyset \}$

$\text{EMPTY}_{\text{REX}} = \{ R \mid R \text{ is a regexp such that } L(R) = \emptyset \}$

# The Emptiness Problem for TMs

$$\text{EMPTY}_{\text{TM}} = \{ M \mid M \text{ is a TM such that } L(M) = \emptyset \}$$

*Given a program, does it reject every input?*

**Theorem:**  $\text{EMPTY}_{\text{TM}}$  is *not* recognizable

**Proof:** Show that  $\neg A_{\text{TM}} \leq_m \text{EMPTY}_{\text{TM}}$   
 $f(z) := \text{Decode } z \text{ into a pair } (M, w).$

Output a TM  $M'$  with the behavior:

“ $M'(x) := \text{if } (x = w) \text{ then}$   
 $\text{run } M(w) \text{ and output its answer, else } \textit{reject}$ ”

$$\begin{aligned} z \in A_{\text{TM}} &\iff L(M') \neq \emptyset \\ &\iff M' \notin \text{EMPTY}_{\text{TM}} \\ &\iff f(z) \notin \text{EMPTY}_{\text{TM}} \end{aligned}$$

# The Equivalence Problem

$$EQ_{TM} = \{(M, N) \mid M, N \text{ are TMs and } L(M) = L(N)\}$$

*Do two programs compute the same function?*

**Theorem:**  $EQ_{TM}$  is *unrecognizable*

**Proof:** Reduce  $EMPTY_{TM}$  to  $EQ_{TM}$

Let  $M_{\emptyset}$  be a “dummy” TM  
with no path from start state to accept state

**Define  $f(M) := (M, M_{\emptyset})$**

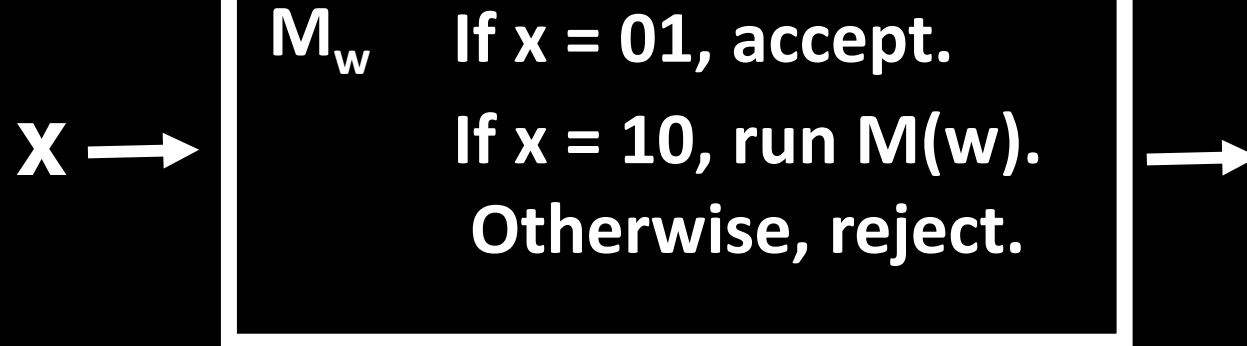

$$\begin{aligned} M \in EMPTY_{TM} &\iff L(M) = L(M_{\emptyset}) = \emptyset \\ &\iff (M, M_{\emptyset}) \in EQ_{TM} \end{aligned}$$

## Problem 1

**REVERSE = { M | M is a TM with the property:  
for all w, M(w) accepts  $\Leftrightarrow$  M(w<sup>R</sup>) accepts }.**

**Decidable or not?**

**REVERSE is undecidable.**

Given a machine  $D$  for deciding  
the language REVERSE,  
we show how to decide  $A_{TM}$

$M(w)$  accepts  $\rightarrow L(M_w) = \{01, 10\}$   
 $M(w)$  doesn't acc  $\rightarrow L(M_w) = \{01\}$

## **Problem 2**      **Undecidable**

$\{ (M, w) \mid M \text{ is a TM that on input } w, \text{ tries to move its head past the left end of the input} \}$

## **Problem 3**      **Decidable**

$\{ (M, w) \mid M \text{ is a TM that on input } w, \text{ moves its head left at least once, at some point} \}$

## Problem 2      Undecidable

$L' = \{ (M, w) \mid M \text{ is a TM that on input } w, \text{ tries to move its head past the left end of the input} \}$

**Proof:** Reduce  $A_{TM}$  to  $L'$

On input  $(M, w)$ , make a TM  $N$  that shifts  $w$  over one cell, marks a special symbol  $\$$  on the leftmost cell, then simulates  $M(w)$  on the tape.

If  $M$ 's head moves to the cell with  $\$$  but has not yet accepted,  $N$  moves the head back to the right.

If  $M$  accepts,  $N$  tries to move its head past the  $\$$ .

$(M, w)$  is in  $A_{TM}$  if and only if  $(N, w)$  is in  $L'$

## Problem 3      Decidable

$\{ (M, w) \mid M \text{ is a TM that on input } w, \text{ moves its head left at least once, at some point} \}$

On input  $(M, w)$ , run  $M$  on  $w$  for  
 $|Q_M| + |w| + 1$  steps.

<b>Accept</b>	If $M$ 's head moved left at all
<b>Reject</b>	Otherwise

*(Why does this work?)*

# Rice's Theorem

Suppose **L** is a language that satisfies two conditions:

1. **(Nontrivial)** There are TMs  **$M_{YES}$**  and  **$M_{NO}$** ,  
where  **$M_{YES} \in L$**  and  **$M_{NO} \notin L$**
2. **(Semantic)** For all TMs  $M_1$  and  $M_2$  such that  
 **$L(M_1) = L(M_2)$** ,  **$M_1 \in L$**  if and only if  **$M_2 \in L$**

**Then, L is undecidable.**

**A Huge Hammer for Undecidability!**

# Examples and Non-Examples

## Semantic Properties $P(M)$

- $M$  accepts 0
- for all  $w$ ,  $M(w)$  accepts iff  $M(w^R)$  accepts
  - $L(M) = \{0\}$
  - $L(M)$  is empty
  - $L(M) = \Sigma^*$
- $M$  accepts 154 strings

## Not Semantic!

- $M$  halts and rejects 0
- $M$  tries to move its head off the left end of the tape, on input 0
- $M$  never moves its head left on input 0
- $M$  has exactly 154 states
  - $M$  halts on all inputs

$L = \{M \mid P(M) \text{ is true}\}$   
is undecidable

**Rice's Theorem:** Any nontrivial semantic L over Turing machines is undecidable.

**Proof:** We'll reduce  $A_{TM}$  to the language L

Define  $M_{\emptyset}$  to be a TM that never halts

Suppose first that  $M_{\emptyset} \notin L$

Let  $M_{YES} \in L$  (such  $M_{YES}$  exists, by assumption)

**Reduction from  $A_{TM}$**  On input  $(M, w)$ , output:

$M_w(x) := \text{If } (M \text{ acc. } w) \ \& \ (M_{YES} \text{ acc. } x) \text{ then ACCEPT}$   
else REJECT

If  $M_{\emptyset} \in L$  instead, we can reduce  $\neg A_{TM}$  to L. Output:

$M_w(x) := \text{If } (M \text{ acc. } w) \ \& \ (M_{NO} \text{ acc. } x), \text{ then ACCEPT}$   
else REJECT

# The Regularity Problem for Turing Machines

$\text{REGULAR}_{\text{TM}} = \{ M \mid M \text{ is a TM and } L(M) \text{ is regular} \}$

*Given a program, is it equivalent to some DFA?*

**Theorem:**  $\text{REGULAR}_{\text{TM}}$  is *not* recognizable

**Proof 1:** Show that  $\neg A_{\text{TM}} \leq_m \text{REGULAR}_{\text{TM}}$

$f(z) :=$  Decode  $z$  into  $(M, w)$ . Output a TM  $M'$ :

“ $M'(x) :=$  if  $(x = 0^n 1^n)$  then run  $M(w)$   
else reject”

$z \in A_{\text{TM}} \Rightarrow f(z) = M'$  such that  $M'$  accepts  $\{0^n 1^n\}$

$z \notin A_{\text{TM}} \Rightarrow f(z) = M'$  such that  $M'$  accepts nothing

$z \notin A_{\text{TM}} \Leftrightarrow f(M, w) \in \text{REGULAR}_{\text{TM}}$

# The Regularity Problem for Turing Machines

$\text{REGULAR}_{\text{TM}} = \{ M \mid M \text{ is a TM and } L(M) \text{ is regular} \}$

*Given a program, is it equivalent to some DFA?*

**Theorem:**  $\text{REGULAR}_{\text{TM}}$  is *not* recognizable

**Proof 2:** Use Rice's Theorem!

$\text{REGULAR}_{\text{TM}}$  is nontrivial:

- there's an  $M_\emptyset$  which never halts:  $M_\emptyset \in \text{REGULAR}_{\text{TM}}$
- there's  $M'$  deciding  $\{0^n 1^n \mid n \geq 0\}$ :  $M' \notin \text{REGULAR}_{\text{TM}}$

$\text{REGULAR}_{\text{TM}}$  is semantic:

If  $L(M) = L(M')$  then  $L(M)$  is regular iff  $L(M')$  is regular,  
therefore  $M \in \text{REGULAR}_{\text{TM}}$  iff  $M' \in \text{REGULAR}_{\text{TM}}$
